

Module

- ↳ Register bit variables and association
- ↳ tab code → Return state
- ↳ generation method

call tab creation method

create tab
(returns result)

change variables
in module.py file

wait for file generation
orders

→ Result goes
to file generation
method

Provides info
on which nodes to
access

Module.py

Variables

- bits that change with selection
- values from selection
- register creation

selection info and
options

Methods

→ tab call

↳ must return is_open

↳ must return values from the selections

→ tab support
